## Why Clay?

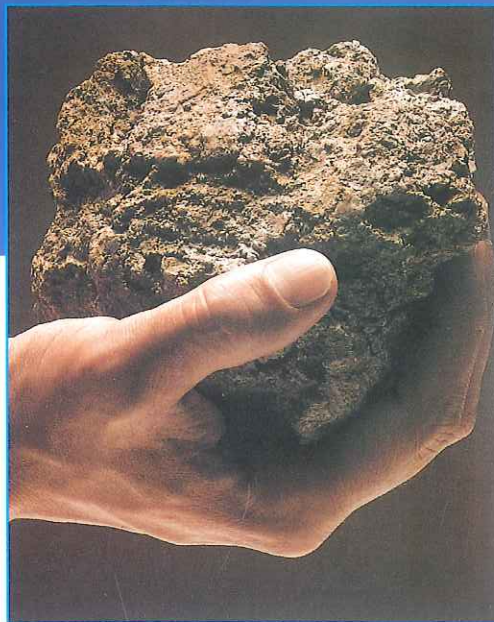

It's cheap, abundant, and readily available in most parts of the world. It is easily formed, assembled, and maintained. It has a proven record of corrosion resistance, longevity in service and reliability.

Clay is the "original" material used in water and public health engineering works. The Egyptians used fired clay containers to convey and store water 5000 years ago. Later, the Romans formed fired clay pipes to convey clean and dirty water.

Clay pipe is non-combustible. The pipe is vitrified at temperatures above 1000°C effectively eliminating any combustible material.

Clay is also extremely "green." It is by far the most environmentally-friendly material that can be used for transporting waste. Many of those re-discovered ancient pipes are found to be still be in good working condition, their corrosion resistance intact. Other sewer systems, some built as recently as the 20th century, and made of other materials, such as asbestos-cement, concrete, iron and plastics, have already deteriorated rapidly, allowing toxic material to seep into the ground.

And finally, clay pipes are easily recyclable. Unlike plastic and other pipes, they can be easily re-used and refabricated to produce new pipe material. That saves money... and helps save the environment too.

## Why Sunway VCP ?

**Sunway VCP** offers world class technical and economical solutions for drainage and sewerage works. We provide a complete product range of pipes and fittings made of vitrified clay in standard dimensions and diameters ranging from of 150 to 1400 mm.

- Advanced European technology
- Superior in quality
- High structural strength
- Fully glazed inside and out
- Heat and chemical resistant
- Proven durability
- Socket/spigot type with prefabricated flexible joints
- Approved to MS 1061:1999 and BS EN 295
- Safe and easy palletised packing

## Quality assurance, tested tough

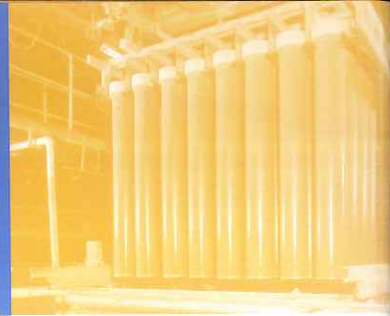

**Sunway VCP** pipes are manufactured to meet stringent quality control criteria. Our manufacturing process includes numerous quality control checks and testing of samples from all pipes and fittings daily. These include tests, but not limited to the following :

- accurate dimensional tolerance
- bending moment resistance
- crushing strength
- water tightness
- chemical resistance
- deflection
- shear resistance

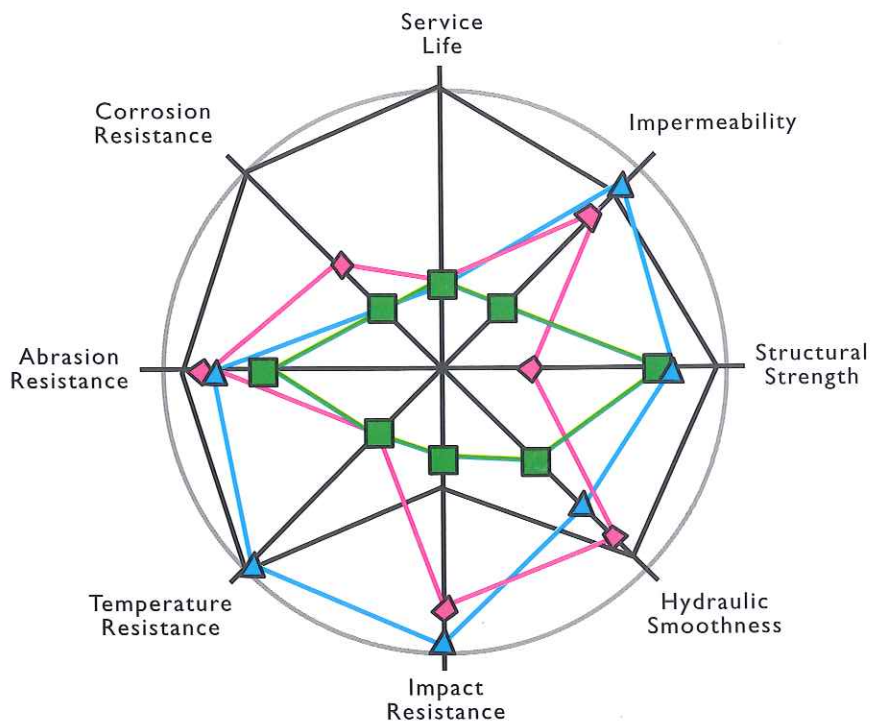

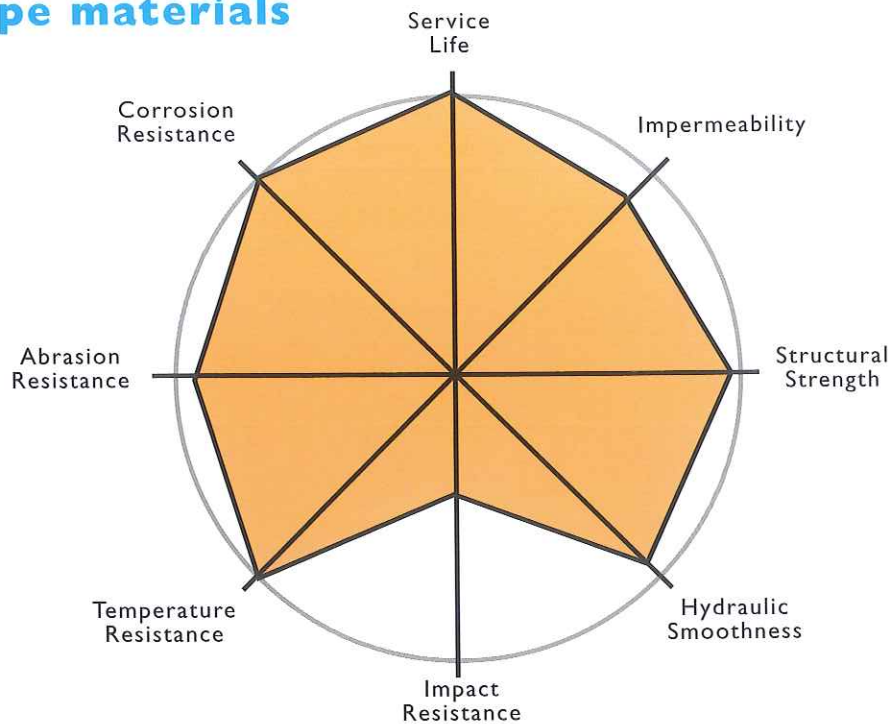

**SUNWAY VCP**

# The superiority of vitrified clay pipes (vcp)

## vcp compared with other pipe materials

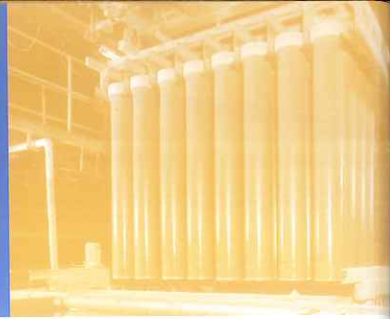

In systems relying on gravity operation such as foul sewers, stormwater sewers and irrigation drainage, the pipeline materials used are principally clay, concrete and plastics (PVC, GRP, polyethylene, etc.). Studies made by independent European industry analysts G. Petzow and H. Schubert attest to the superior qualities of vitrified clay. Their findings are diagrammed, utilising eight criteria which are placed as loci on a circular "performance chart." These indicate the relative advantages and disadvantages of each material in the areas of service life, impermeability, impact resistance, etc.

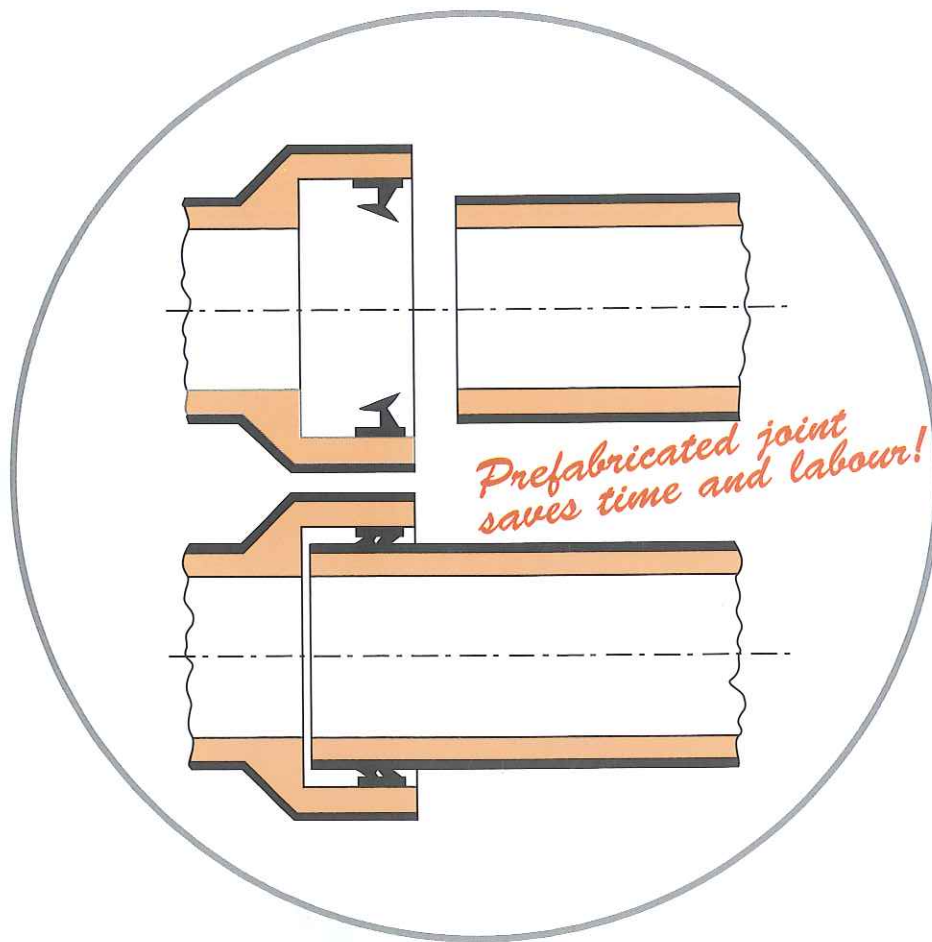

## Summary of the properties of sewer pipes

<b>Properties</b>	<b>Vitrified Clay</b>	<b>Concrete</b>	<b>PVC</b>	<b>GRP</b>	<b>Steel / DI</b>	<b>HDPE</b>
Longevity (yrs)	100+	As conditions dictate	25+	25+	As conditions dictate	Not Known
Resistance to corrosion	Very good	Poor (Protection often required)	Good	Good	Poor (Protection often required)	Good
Resistance to abrasion	Very good	Fair	Good	Good	Good	Good
Length (mm)	1500 to 2500	3000	6000	6000	6000	6000
Flexible jointing system	Yes	Yes	Yes	Yes	Yes	Yes
<div>Strengths</div> <div>Depending on size and strength classifications</div>						
Sizes (mm)	150 to 1400	300 to 3600	50 to 600	80 to 2500	80 to 2400	
Design	Simple	Simple	Complex	Complex	Complex	Complex
Workmanship required in placement	Minimum	Minimum	Very careful	Very careful	Minimum	Very careful
Supervision required during placement	Minimum	Minimum	Substantial	Substantial	Minimum	Substantial
Maintenance	Minimum	Periodic check when effluents are corrosive	Periodic check for elliptical deformation	Periodic check for elliptical deformation	Usually minimum but frequent if cathodic protection provided	Periodic check for elliptical deformation

## The unique jointing system of Sunway VCP

Sunway VCP vitrified clay pipes is designed with L Jointing System. This System is manufactured in accordance with the quality standards established for flexible jointed pipes.

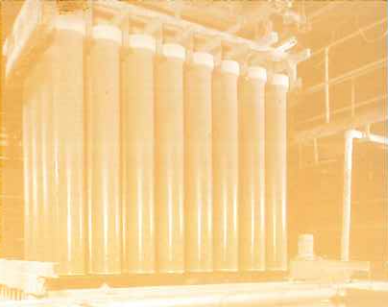

### THE 'L' JOINT

Consists of a rubber lip ring fixed in the pipe socket with an epoxy sealant. No joint on the spigot end is required. Diameters: DN 150 - 600 mm.

**Note:**

- Within the BS EN 295 (European Standard) L refers to jointing systems F.
- Lubricant - In order to facilitate installation of the pipes, a special lubricant is provided.

## Crushing strength comparison

### SUNWAY VCP VITRIFIED CLAY PIPES & FITTINGS

Sunway VCP vitrified clay pipes are glazed internally and externally. The pipes and fittings come complete with prefabricated lip rings (L joint 600 mm) for user friendly effective installations.

### COMPARISON OF CRUSHING STRENGTH VALUES OF MS 1061:1999 AND BS EN 295

According to technical specifications and prescribed norms, a specific pipe type can be selected on the basis of following tabulation of minimum allowed crushing strengths (denominated in kilo Newton per metre, kN/m).

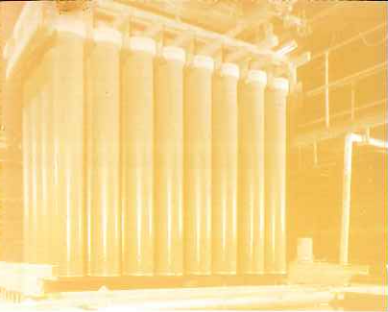

Pipes			MS 1061:1999			BS EN 295			
			Crushing Strength (kN/m)			Crushing Strength (kN/m)			
Diameter DN (mm)	Joint	Length (mm)		Class			Class		
				120	160		120	160	200
150	L	1500	FN 34			FN 28/34			
200	L	1750/2000		24	32		24	32	40
225	L	1750/2000		28	36		28	36	45
250	L	2000		30	40		30	40	
300	L	2000		36	48		36	48	60
375	L	2000		45			45		
450	L	2000		54	72		54	72	
600	L	2000		72	96		72	96

## Bedding preparation for Sunway VCP pipes

The latest methods of manufacture and control have enabled **Sunway VCP** to guarantee their pipes to be of high load bearing strengths. The total structural load that a pipeline can carry depends on the combination of the pipe bedding on which it is laid. Thus, high strength bedding can be used with low strength pipes or low strength bedding with high strength pipes.

**Sunway VCP** pipes require only low bedding strengths due to their inherent strong body. In normal soil conditions (G2, G1, G3), **Sunway VCP** pipes require only a flexible bedding of granular materials or laid directly on the trimmed bottom of the trench. With higher loadings, a concrete bedding can become necessary or higher strength pipes used. As a general guide, the following tables are recommended for **Sunway VCP** pipes. However, depending on prevailing site conditions, other combinations of static parameters apply.

### Bedding recommendations

Single trench with groundwater, trench width according to EN 1610 with trench sheeting and different traffic loads.

# Trench and bedding preparation

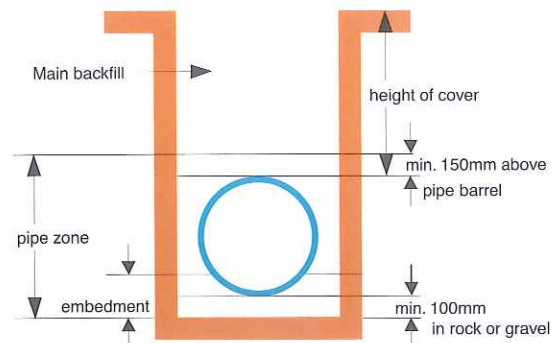

## NOMENCLATURE to A 127 (ATV - Working Sheet)

### Types of soil

- G1 : Non-cohesive soils (sand, coarse gravel or sand and gravel mixtures )
- G2 : Slightly cohesive soils (clayey sand or sand and gravel)
- G3 : Cohesive mixed soils, silt

### Conditions for backfilling of the trench above pipe zone

- A1 : In layers compacted backfill against the undisturbed soil (without identification of the degree of compaction).
- A2 : Vertical trench sheeting by means of steel piles or light interlocking steel piles, only to be removed after the backfilling of the trench. Frame-type trench shores or equipment, which are removed step-by-step in the process of the backfilling. Uncompacted trench backfilling.
- A3 : Vertical trench sheeting with heavy interlocking steel piles, poling boards, frame-type trench shoring etc., removed only after backfilling.

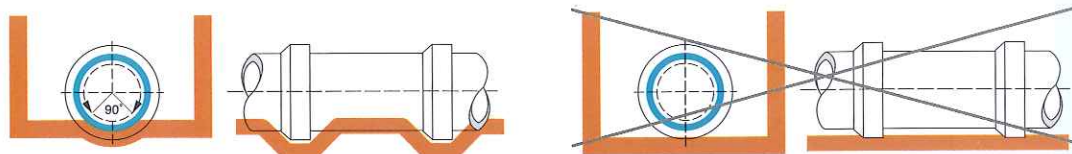

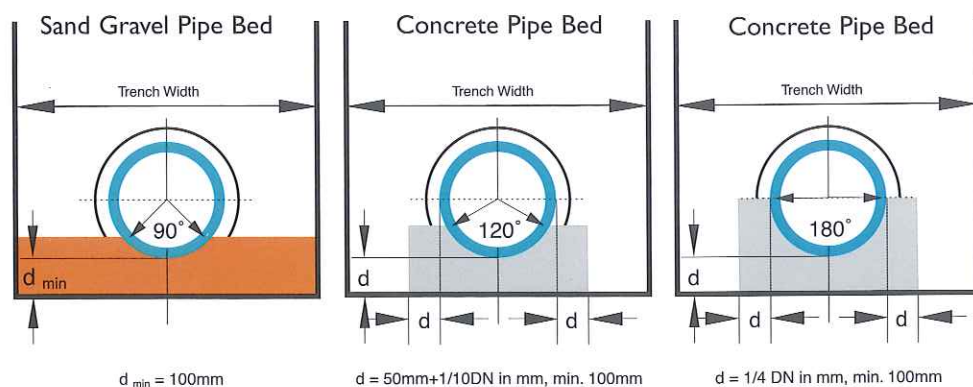

### Conditions for embedding of pipelines

- B1 : In layers compacted backfill against the undisturbed soil, or in embankment (without identification of the degree of compaction).
- B2 : Vertical trench sheeting within the pipe zone by means of steel sheet piles or light interlocking piles, only to be removed after the backfilling of the trench. Frame-type trench shores or equipment, the assumption that the compaction of the soil is assured after the removal of the equipment.
- B3 : Vertical trench sheeting within the pipe zone with heavy interlocking sheet piles, poling boards, frame-type trench shorting etc., without effective compaction after the removal of the equipment.

## TYPES of pipe bedding

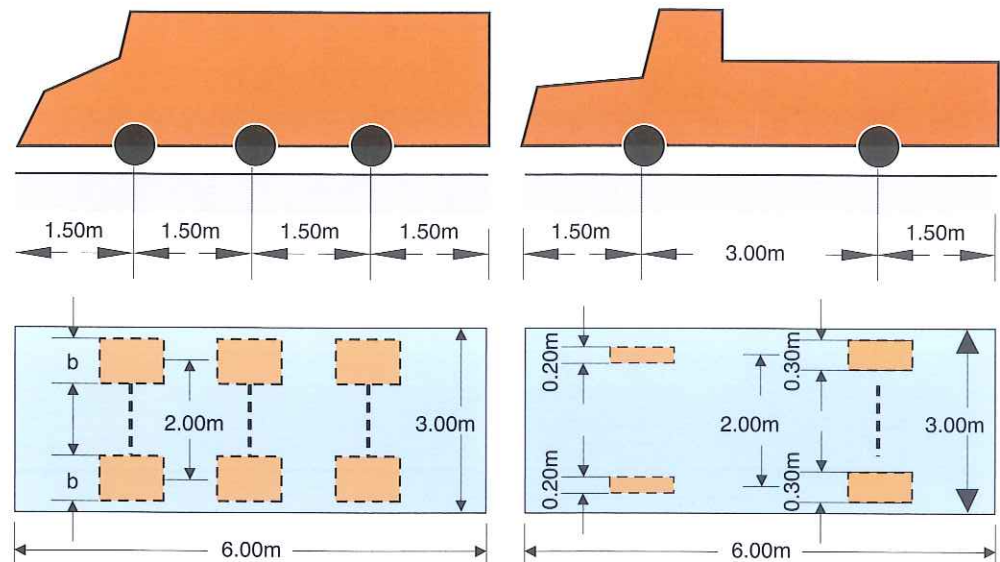

to EN 1610 and ATV - working sheet A 127

Socket holes must be made so that the sockets do not lie on a compacted bottom. This would result in point loading. Support must be provided over the whole barrel length.

# Trench and bedding preparation

## Traffic Loads

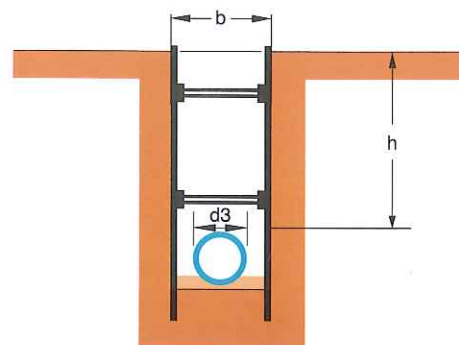

### Traffic Loads

standard vehicle	total load (kN)	wheel load (kN)	wheel contact area		substitution load (kN/m <sup>2</sup> )
			width (m)	length (m)	
SLW 60	600	100	0.6	0.2	33.3
SLW 30	300	50	0.4	0.2	16.7
LKW 12	120	front 20	0.2	0.2	6.7
		rear 40	0.3	0.2	6.7

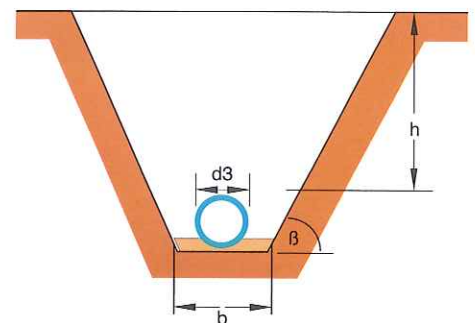

### Minimum trench width according to EN1610

DN	Minimum trench width (m)		
	Supported trench	Unsupported trench	
		$\beta > 60$	$\beta \leq 60$
$\leq 225$	$b = d3 + 0.40$	$b = d3 + 0.40$	$b = d3 + 0.40$
$> 225$ to $\leq 350$	$b = d3 + 0.50$	$b = d3 + 0.50$	$b = d3 + 0.40$
$> 350$ to $\leq 700$	$b = d3 + 0.70$	$b = d3 + 0.70$	$b = d3 + 0.40$
$> 700$ to $\leq 1200$	$b = d3 + 0.85$	$b = d3 + 0.85$	$b = d3 + 0.40$
$> 1200$	$b = d3 + 1.00$	$b = d3 + 1.00$	$b = d3 + 0.40$

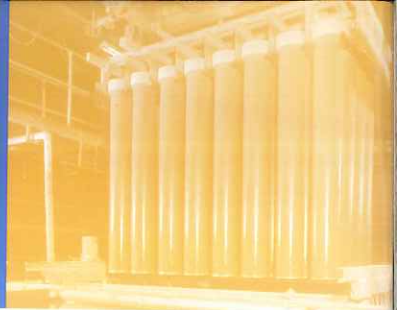

Note: d3 is the outer diameter of pipe barrel

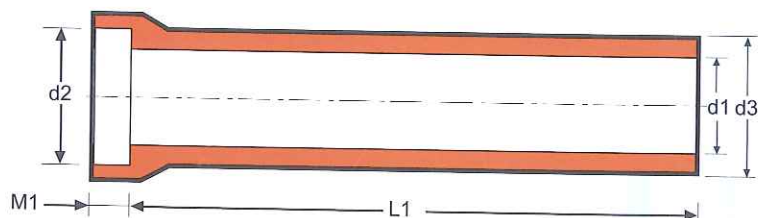

narrow / supported trench

wide / unsupported trench

### Clay Stoppers

Diameter DN(mm)	For Joint	Weight (kg/pc)
150	L	2
200	L	4
225	L	6
300	L	10

### Saddles

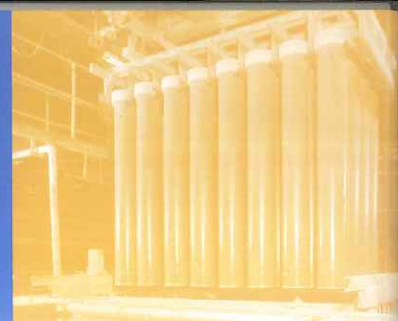

Branch Diameter DN(mm)	Main line diameter			
	DN 225	DN 300-350	DN 400-600	DN 700-1200
150	x	x	x	x
200		x	x	x
225		x	x	x

When ordering, please mention DN of main line.

**Note:**

Peculiar to the ceramic manufacturing process, all weights and dimensions are as close as accurately possible.

## Accessories for use with vitrified clay pipes

### Stainless Steel Coupling

The couplings is carefully selected and primarily designed for jointing pipes without sockets.

This coupling requires the ability to provide a reliable seal and resistance against heavy earth loads and flexible joint.

It is especially useful for repair new or existing pipelines.

Ranges available: 150mm – 450mm diameters.

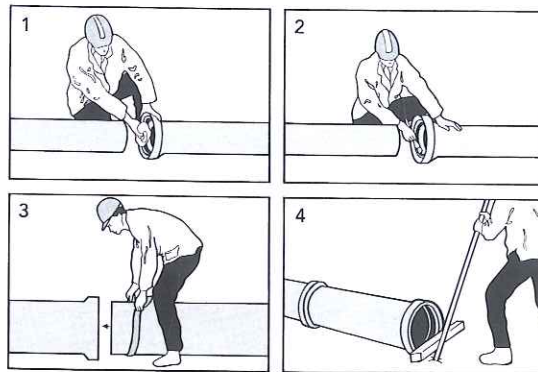

### Pipecutter

Clay pipes can be cut to desired lengths by using a cutting chain for diameters up to DN 300mm.

For diameters greater than DN 300mm can use portable disc cutter.

## Laying of Sunway VCP vitrified clay pipes

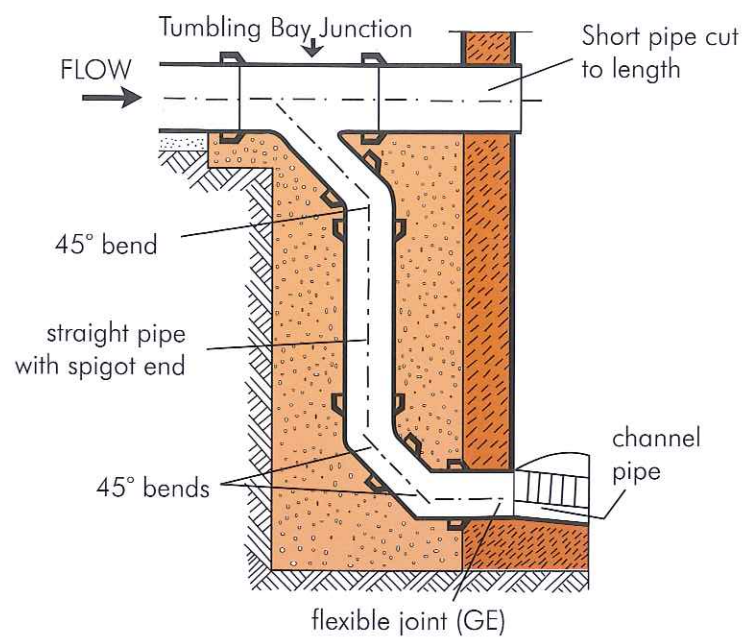

### Pipes with L Joint

Instructions:

- Clean socket and spigot joints.
- Apply lubricant on inside of joint.
- Align spigot into socket.
- Push spigot into socket with crowbar.

### Construction of Backdrop Manholes

- With backdrop junctions.
